

# Proof that Clique Decision problem is NP-Complete

Difficulty Level : Expert • Last Updated : 13 Jun, 2020

**Prerequisite:** [NP-Completeness](#)

A clique is a subgraph of a graph such that all the vertices in this subgraph are connected with each other that is the subgraph is a complete graph. The Maximal Clique Problem is to find the maximum sized clique of a given graph  $G$ , that is a complete graph which is a subgraph of  $G$  and contains the maximum number of vertices. This is an optimization problem. Correspondingly, the Clique Decision Problem is to find if a clique of size  $k$  exists in the given graph or not.

To prove that a problem is NP-Complete, we have to show that it belongs to both NP and NP-Hard Classes. (Since NP-Complete problems are NP-Hard problems which also belong to NP)

to verify in polynomial time if it is a solution to the problem.

**Proof:**

1. Certificate – Let the certificate be a set  $S$  consisting of nodes in the clique and  $S$  is a subgraph of  $G$ .
2. Verification – We have to check if there exists a clique of size  $k$  in the graph. Hence, verifying if number of nodes in  $S$  equals  $k$ , takes  $O(1)$  time. Verifying whether each vertex has an out-degree of  $(k-1)$  takes  $O(k^2)$  time. (Since in a complete graph, each vertex is connected to every other vertex through an edge. Hence the total number of edges in a complete graph  $= {}^kC_2 = k*(k-1)/2$ ). Therefore, to check if the graph formed by the  $k$  nodes in  $S$  is complete or not, it takes  $O(k^2) = O(n^2)$  time (since  $k \leq n$ , where  $n$  is number of vertices in  $G$ ).

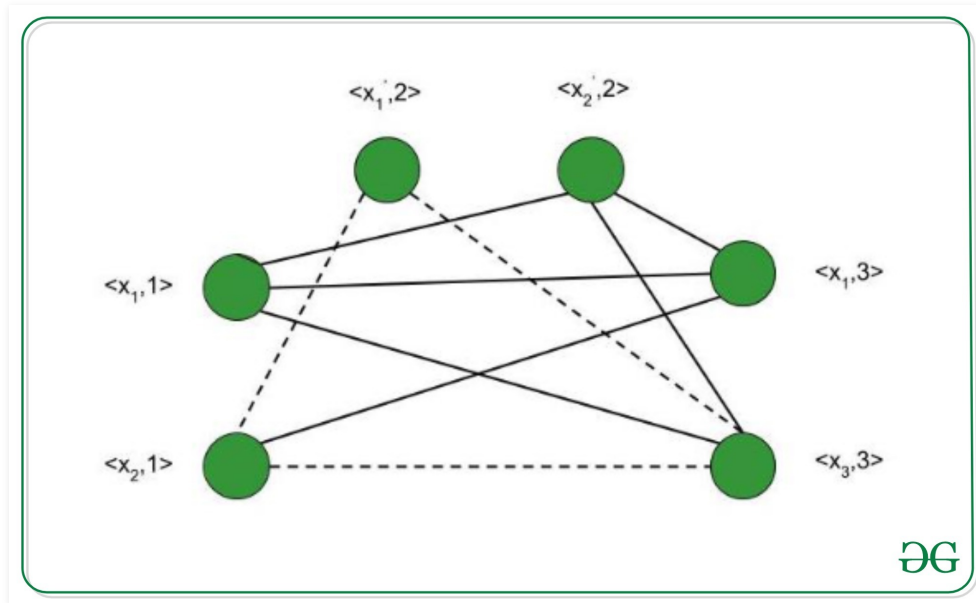

Therefore, the Clique Decision Problem has polynomial time verifiability and hence belongs to the NP Class.

**The Clique Decision Problem belongs to NP-Hard** – A problem  $L$  belongs to NP-Hard if every NP problem is reducible to  $L$  in polynomial time. Now, let the Clique Decision Problem be  $C$ . To prove that  $C$  is NP-Hard, we take an already known NP-Hard problem, say  $S$ , and reduce it to  $C$  for a particular instance. If this reduction can be done in polynomial time, then  $C$  is also an NP-Hard problem. The Boolean Satisfiability Problem ( $S$ ) is an NP-Complete problem as proved by the [Cook's theorem](#). Therefore, every problem in NP can be reduced to  $S$  in polynomial time. Thus, if  $S$  is reducible to  $C$  in polynomial time, every NP problem can be reduced to  $C$  in polynomial time, thereby proving  $C$  to be NP-Hard.

Proof that the Boolean Satisfiability problem reduces to the Clique Decision Problem

Let the boolean expression be –  $F = (x_1 \vee x_2) \wedge (x_1' \vee x_2') \wedge (x_1 \vee x_3)$  where  $x_1, x_2, x_3$  are the variables, ' $\wedge$ ' denotes logical 'and', ' $\vee$ ' denotes logical 'or' and  $x'$  denotes the complement of  $x$ . Let the expression within each parentheses be a clause. Hence we have three clauses –  $C_1, C_2$  and  $C_3$ . Consider the vertices as –  $\langle x_1, 1 \rangle; \langle x_2, 1 \rangle; \langle x_1', 2 \rangle; \langle x_2', 2 \rangle; \langle x_1, 3 \rangle; \langle x_3, 3 \rangle$  where the second term in each vertex denotes the clause number they belong to. We

2. No variable is connected to its complement.

Thus, the graph  $G(V, E)$  is constructed such that  $V = \{ \langle a, i \rangle \mid a \text{ belongs to } C_i \}$  and  $E = \{ ( \langle a, i \rangle, \langle b, j \rangle ) \mid i \text{ is not equal to } j ; b \text{ is not equal to } a' \}$ . Consider the subgraph of  $G$  with the vertices  $\langle x_2, 1 \rangle$ ;  $\langle x_1', 2 \rangle$ ;  $\langle x_3, 3 \rangle$ . It forms a clique of size 3 (Depicted by dotted line in above figure). Corresponding to this, for the assignment  $\langle x_1, x_2, x_3 \rangle = \langle 0, 1, 1 \rangle$   $F$  evaluates to true. Therefore, if we have  $k$  clauses in our satisfiability expression, we get a max clique of size  $k$  and for the corresponding assignment of values, the satisfiability expression evaluates to true. Hence, for a particular instance, the satisfiability problem is reduced to the clique decision problem.

Therefore, the Clique Decision Problem is NP-Hard.

### Conclusion

The Clique Decision Problem is NP and NP-Hard. Therefore, the Clique decision problem is NP-Complete.
